    Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

COFACTOR: Binds 3 calcium ions and 1 sodium ion per subunisubuni: Monomer.

SIMULARITY: Belongs to family 13 of glycosyl hydrolases.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gen. Microbiol. 139:1401-1407(1993).

CAPALYTIC ACTIVITY: Endohydrolysis of 1,4-alpha-glucosidic linkages in oligosaccharides and polysaccharides.

COPACTOR: Binds 1 calcium ion per subunit (By similarity).

SUBCUNIT: Monomer (By similarity).

SUBCELLULAR LOCATION: Cytoplasmic.

Microbiol. 135:3447-3457(1989).
CATALYTIC ACTIVITY: Degrades starch to cyclodextrins by formation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           IN THE AMINO-TERMINAL SIDE CLEAVES THE ALPHA-1,4-GLUCOSIDIC BOND IN STARCH, AND THE OTHER IN THE C-TERMINAL SIDE CATALYZES OTHER ACTIVITIES, INCLUDING THE RECONSTITUTION OF AN ALPHA-1,4-GLUCOSIDIC LINKAGE FOR CYCLIZING THE MALICOLIGOSACCHARIDE PRODUCED.
SIMILARITY: Belongs to family 13 of glycosyl hydrolases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        of a 1,4-alpha-D-glucosidic bond.
COFACTOR: Binds 2 calcium ions per subunit (By similarity).
SUBUNIT: Monomer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            MISCELLANEOUS: CGTASE MAY CONSIST OF TWO PROTEIN DOMAINS: THE ONE

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       GATALYTIC ACTIVITY: Endohydrolysis of 1,4-alpha-glucosidic CATALYTIC ACTIVITY: Endohydrolysis of 1,4-alpha-glucosidic linkages in oligosaccharides and polysaccharides. COPACTOR: Binds 3 calcium ions per subunit (By similarity). SUBUNIT: Monomer.

TISSUE SPECIFICITY: Most abundant in embryo-derived callus tissue. DEVELOPMENTAL STAGE: Expressed at a high level during germination in the aleurones cells under the control of the plant hormone gibberellic acid and in the developing grains at a low level. SIMILARITY: Belongs to family 13 of glycosyl hydrolases.
